

Hanabi Matsuri

After opening the Event Promotion Page, I open the accessibility options with COMMAND + OPTION + F5, and enable Voiceover.

Voiceover read the html page context.

Voiceover will read each header by starting saying HEADER 1 ... HEADER 2.... and such. It will read out all the context but there was a few problem.

- 1) For all numbers, it will only read out each individual number. For example for July 30th, it will read out as July-three-zero, not July thirty. For time, instead of 17o'clock 30 minutes, it will read one-seven:three zero.
- 2) For all information, the punctuation used for format or design purposes to identify the context, it will be very confusing using Voiceover. For example: Admission: Free | 500 for reserved seat. Instead of automatically identifying as Free or 500 for reserved seat, it read as Free, vertical line, 500 for.....
- 3) For all webs tire url links, it read out each individual alphabet, and it read out each alphabet too fast

Need to Change: In order for the context to sound smoother for accessibility option, all the punctuation or number context has to change to actual wording for Voiceover to read out.

If I want to enter the link, I have to use CONTROL + OPTION + Space Bar. If I want to pause the voiceover, I can use CONTROL. After finishing and to exit Voiceover, I can use OPTION + COMMAND +F5.
